Deploy console README

Admin stick steps · GREGW-NORTH

Closing page · TASKalfa booklet notes

This booklet is the readable pair of READMEs as they stand on 12 September 2026: the public front door (START_HERE / PRODUCT / CAPABILITIES) and the private Kyocera edition current file plus the deploy-console README. The long GitHub engine README and the retired FULL/SALES launcher chapters are omitted on purpose.

PART I · PUBLIC CHASSIS

Start here

You already have Google. You already have a chatbot in a browser. That is not the problem.

The problem is a tech on a live call who types **what is an F248** and gets a paragraph that sounds smart and is wrong. They give up. The machine is still down. That is not stupidity. That is a tool that asked them to be a prompt engineer on a service call.

North Forge is the opposite of that. Plug in the stick. Double-click **Start North Forge**. Type the code, the model, what you already tried, in ordinary English. It is supposed to answer like a senior on the desk who has seen the call before — and to say “I don’t have that, send me the page” instead of making one up.

If you came here because you do not trust “AI,” good. Neither does this page. Distrust is earned. A tool that hides the hole and fills it with confidence is why people walk away. This one is built to show the hole.

It is for the person who never wants to see the word *model*. It is for the expert who is tired of tools that move every six weeks. It is for the book-smart person who can recite a manual and still cannot reason through a paper path. It is not a test. There is no prompt to memorize.

Why Google is not enough

Google is a pile of pages. A general chatbot is a pile of pages with manners. Neither one knows *your* fleet, *your* last three tickets, or that F248 on *this* model is not the same story as F248 on the last one.

A usable answer on this job is short, ordered, and honest:

1. What to look at first
2. What not to touch yet
3. What evidence to grab if it is still dead
4. What we do not know yet

That takes years of compartmentalized TSC work — device, PC, network, PaperCut, MyQ, the rest — sitting in procedures, not in an 8,000-character prompt the tech will never write. The 8,000-character prompt already happened. You do not have to write it. That is the point of the stick.

What “humanizer” means here

No “Great question.” No fake certainty. No essay when you asked for a code. A voice that sounds like a person who has been on the tools, not a product blog. It learns what *you* just taught it. It is supposed to keep that. It is supposed to correct itself when you catch it. That is the pocket brain: not a genius in the cloud, a go-to on the desk that gets less wrong the longer your shop uses it.

How small the first step is

1. Plug the stick in.
2. Double-click Start North Forge.
3. Type the problem the way you would tell a coworker.
4. If you get lost, type /menu.

Do not format the stick. Do not “set up Python.” Do not learn a vendor.

Who built this

Kenneth C. Walker Jr. — decades on this industry, including the years when the answer lived in a binder and a senior, not in a search box. The pace of new tools is the problem. This pack is how the work got compartmentalized so a teammate does not have to drink the whole firehose to clear one code.

Product

North Forge is a portable support assistant: device, PC, network, PaperCut, MyQ, the rest of the document stack the edition has been taught. An administrator loads a private manufacturer pack (Kyocera today; Sharp, Ricoh, Xerox later). The tech types ordinary English. It is supposed to **show a knowledge gap instead of inventing a fix**, then keep the answer once you supply it.

- Public repo = working stick, generic chassis.
- Private edition = the actual TSC brain (this is the product).
- Teammate experience = plug in → Start North Forge → talk like a coworker.

What it can actually do

Three years of TSC work went into the pack. The hard part of the docs is not listing buttons. It is saying the assistant is supposed to know when it does not know.

The job

Sit next to a tech. Cover the messy middle of a call:

- Electro-mechanical devices (print / scan / finish / paper path / supplies)
- The PC and network the device is on (Windows, macOS, Linux)
- Field stacks the edition has been taught, including PaperCut and MyQ
- Other document-management and fleet tools in that pack

Layer	Now
Pocket path	USB / SSD, 8 GB or larger. Double-click Start North Forge.
Public overlays	Field-service voice, Pocket Penny, Pine Barron Farms.
Private edition	Intake, ticket, KB, escalation, fault log, training.
Honesty	Fact / sourced / inferred / unknown. No confident fiction.
Voice	Senior on the desk. No “Great question.”
Hands	Typed session today. Messaging gateway optional.

Not yet — do not demo as shipped

- Not a magic lie detector. It is a working rule about holes.
- Not a full graphical console for the tech (admin Deploy Console only).
- Not a database product yet.
- Graph / slides / video / picture tools in the TSC loop are planned.
- Offline only with a local model on the stick. Cloud needs a network.
- Windows teammate path first. Docker is admin / lab, not the hotline handoff.

PART II · KYOCERA EDITION README

Current — read this first

Version profile 0.1.0 · 12 September 2026 · Author Kenneth C. Walker Jr. · Private. This is the TSC pack. The public engine is not the product.

The person who should never see this chapter is the teammate. They get a stick and the card titled FOR THE PERSON GETTING THIS DRIVE.

Why this pack exists

A tech types what is an F248 into Google or a generic chatbot and gets a confident wrong paragraph. They give up. That is not on them. Nobody on a live call is going to paste an 8,000-character prompt.

This pack is that prompt, broken into compartments: device, PC, network, PaperCut, MyQ, ticket, KB, escalation. The tech talks like a coworker. If the pack does not have the page, it is supposed to say so and keep the answer after someone supplies it.

Architecture since 11 September 2026: this repo is a profile pack that installs into the public North Forge checkout. FULL/SALES launchers in the long historical README are history.

Domain

- Print / scan / finish / paper path / supplies
- Host PC and network (Windows, macOS, Linux)
- PaperCut, MyQ, other document tools the skills know
- Hotline, KB, escalation, fault history, new-hire training

Skill catalog

Skill	Types	Job
menu	/menu	Front door
assist-intake	/a /assist	Structured intake
hotline-ticket	/hl /ticket	Hotline / ticket packet
kb-builder	/kb	Draft to locked KB template
draft-writer	/draft	Shorter draft pass
escalation-packet	/esc	Escalation with evidence on hand
fault-logging	/log /fault	Durable fault record
forge-audit	/audit /chk	Check a draft against the rules
training-guide	/train	Teach a new tech the workflow
sales-assist	sales prompts	Pre-sales guidance
web-navigator	vendor hops	Official public pages only
kyocera-research	research / cron	Release-note watch
daily-brief	brief	Morning digest

A Sharp or Ricoh edition is this same table with different portals and templates.

Deploy console README

Version 0.2.0 · 12 September 2026 · Admin only. Lives in the private Kyocera edition under Advanced/deploy-console/.

A teammate should never type git, gh, or PowerShell. Those belong on the admin PC, once. After a one-time GitHub sign-in, every stick is: plug in → Run as administrator → fill in the web page → wait.

What a finished stick contains

```
E:\ Start North Forge.lnk
E:\ HOW_TO_START.txt · ASSIGNED_TO.txt
E:\ north-forge-agent\ (engine)
E:\ north-forge-agent\private-editions\kyocera\ (this pack)
E:\ north-forge-agent-venv\ and north-forge-agent-data\
```

Stick types

Locked — teammate cannot switch projects. **Open** — admin can switch later. Kyocera is the priority pin. Pocket Penny, Pine Barron Farms, and field-service are overlays.

Safety: refuses C: and the Windows system drive. Formats only removable USB, and only if you type FORMAT. Format needs Run as administrator. Passcode is hashed on the stick, not stored in this booklet.

Admin stick steps

1. Right-click Launch-Deploy-Console.cmd → Run as administrator.
2. Pick the USB (8 GB or larger).
3. Assigned to: first and last name. Greg Warhol becomes volume label GREGW-NORTH.
4. Agent name: leave blank for North Forge, or type a nickname.
5. Locked stick for a teammate. Kyocera unless you mean otherwise.
6. Type FORMAT. Type the admin passcode twice.
7. Wait. Hand them the stick and HOW_TO_START.txt.

Teammate card (the whole list)

1. Plug the stick in.
2. Open it like any USB drive.
3. Double-click Start North Forge.
4. Wait until a window asks you a question.
5. Type the problem the way you would tell a coworker. Example: TASKalfa 3554ci showing F248 after printing.
6. If you get lost, type /menu.

You do not need a password, GitHub, or a class. You do not need to “learn AI.” If it gives a thin answer, say so. Do not format the stick. If it breaks, hand it back to Kenneth.

Learning device

This is not a search box. On a live call it may be thin until the shop has taught it. When someone supplies the missing procedure — KX versus V4/IPP, the removal tool, spooler, RJ45 out, U917 before U021 / U024 Data Only Format — that answer is supposed to stay. Cron research on an always-on admin PC gathers public industry notes. A stick in a drawer does not crawl the web overnight. What improves is memory, skills, and the research log — not the raw model weights.

CLOSING

Hand them the stick.

They double-click Start North Forge.
They type the model and the code like a coworker.
If it is thin, they say so. It is supposed to keep the answer.

Volume names look like GREGW-NORTH.
Do not format the stick. Do not teach them a vendor.

Kyocera booklet print (TASKalfa):
Print → Layout → Booklet. Paper: Letter.
Duplex as the panel offers for booklet. Staple fold if equipped.
Print this PDF as-is. Do not scale. Do not fit-to-page.

Connecting the agent to a floor device is a later backend.
Today: print this file from any PC to the TASKalfa queue.
